

# Pisces (Two Fish)

## FEBRUARY - 2020

### Did you know?

- It is a fairly large constellation and is 14th among the 88 constellations.
- Every year, the sun crosses the celestial equator into the northern hemisphere at a point in Pisces. This is called the Vernal equinox.
- Pisces has been recognised as a constellation for over 3,000 years. However, ancient Babylonians associated it with a swallow.
- M74, a spiral galaxy some 30 million light-years from Earth and faintly visible through a telescope is found in Pisces.
- Pisces consists of 18 main stars of which Eta Piscium is the brightest.
